

The current claim set, with insertions underlined and deletions bracketed relative to the original issued patent, is as follows:

1. (previously presented) An electronic camera for capturing images representing a variety of subjects and for providing captured images to an external computer in response to a single computer initiated request, wherein the electronic camera is interconnected to the external computer via a cable interface, said camera comprising:

an image sensor for capturing the images;

a converter stage for converting the images into digital image data;

a memory for storing [a plurality of categories] two or more tag names

providing classification of the images [by subject];

control means for selecting one of the stored tag names for each of the images;

a processor [having the capability of] for assigning the [plurality of categories] selected tag names to each of the images captured by the image sensor, wherein each [category] tag name [providing subject] provides classification of [one] two or more captured images;

[a user control means for selecting one or more categories for the images before the images are captured by the image sensor; and]

means for generating [an output image signal comprising] an image file including [both] the digital image data corresponding to the captured images and [separate category data including the one or more categories selected by the user control, wherein the category data is separately accessible for each image apart from the image data] a separate tag name file for each selected tag name;

a removable memory for storing each of the image files into the tag name file corresponding to the selected tag name, wherein the removable memory stores two or more tag name files with each tag name file storing two or more image files; and

means responsive to the single computer initiated request for identifying a particular tag name for transferring all of the image files stored in the corresponding tag name file to the external computer via the cable interface.

2. (previously presented) An electronic camera as claimed in claim 1 wherein the memory is firmware and the [categories] tag names are default categories stored in the firmware.

3. (previously presented) An electronic camera as claimed in claim 2 wherein the [user] control means includes a status display for showing the default categories and the [user] control means selects a particular one of the default categories from those displayed on the status display.

4. (previously presented) An electronic camera as claimed in claim 3 wherein the [user controls] control means includes a first control interface for cycling through the default categories one-by-one and displaying each category individually, and a second control interface for selecting a displayed category.

5. (previously presented) An electronic camera as claimed in claim 1 wherein the [one or more categories] tag names included in the output image data is associated with the digital image data in a distinct file location.

6. (previously presented) An electronic camera as claimed in claim 1 wherein the [one or more categories] tag names included in the output image data is overlaid into the image data.

7. (previously presented) An electronic camera as claimed in claim 1 wherein the camera further comprises a signal port for receiving externally generated user customized tag names [categories], and wherein the processor also stores the externally generated user customized tag names [categories] in the memory and the [user] control means is further capable of selecting a particular one of the externally generated user customized tag names [categories].

8. (previously presented) An electronic camera as claimed in claim 7 wherein the externally generated [categories] tag names are alphanumeric names.

9. (previously presented) An electronic camera as claimed in claim 7 wherein the signal port also receives externally generated text strings for one or more of the [categories] tag names, and wherein the processor also stores the text strings in the memory with the [one or more categories] tag names.

10. (previously presented) An electronic camera as claimed in claim 7 wherein the signal port also receives externally generated graphics images for one or more of the [categories] tag names, and wherein the processor also stores the graphics images in the memory with the [one or more categories] tag names.

11. (previously presented) An electronic camera as claimed in claim 9 wherein the means for generating an [output image signal] image file overlays the text strings into the digital image data.

12. (previously presented) An electronic camera as claimed in claim 10 wherein the means for generating an [output image signal] image file overlays the graphics images into the digital image data.

13. (previously presented) An electronic camera as claimed in claim 1 wherein the memory stores a plurality of default [categories] tag names providing a default classification of the image by a set of codes, and wherein the camera further comprises a signal port for receiving externally generated [categories] tag names, the processor stores the externally generated [categories] tag names in the memory, and the [user] control means preferentially accesses the externally generated [categories] tag names when they are stored in the memory.

14. (previously presented) An electronic camera as claimed in claim 13 wherein the processor includes date and time information with the externally generated [categories] tag names.

15. (previously presented) An electronic imaging system using an electronic camera as claimed in claim 7 in combination with [a host processor] the external computer, wherein the [host processor] external computer provides the externally generated user customized [categories] tag names to the signal port.

25. (cancelled)

26. (previously presented) An electronic camera as claimed in claim 7 wherein the signal port connects to [a] the removable memory [card].

27. (previously presented) An electronic imaging system as claimed in claim 15 wherein the signal port connects to [a] the removable memory [card], and the [host processor] external computer provides the externally generated user customized tag names [categories] to the signal port by writing the [categories] tag names into the removable memory [card].

28. (previously presented) An electronic imaging system as claimed in claim 15 wherein [a cable connection] the cable interface is provided between the signal port and the [host processor] external computer, and the [host

processor] external computer provides the externally generated user customized [categories] tag names over the cable [connection] interface to the signal port.

29. (previously presented) An electronic camera for capturing images representing a variety of subjects and for providing captured images to an external computer in response to a single computer initiated request, wherein the electronic camera is interconnected to the external computer via a cable interface, said camera comprising:

- an image sensor for capturing the images;
- a converter stage for converting the images into digital image data;
- a memory for storing two or more tag names [a plurality of categories]

providing classification of the images [by subject];

control means for selecting one of the stored tag names for each of the images;

a processor [having the capability of] for assigning the [plurality of categories] selected tag names to each of the images captured by the image sensor, wherein each [category] tag name [providing subject] provides classification of [one] two or more captured images;

[a user control means for selecting one or more categories for the images before the images are captured by the image sensor];

means for storing the digital image data in image files; [and]

means for [grouping] storing each of the image files [according to the plurality of categories] into a tag name file corresponding to the selected tag name, wherein two or more tag name files are stored and each tag name file stores two or more image files; and

means responsive to the computer initiated request for identifying a particular tag name for transferring all of the image files stored in the corresponding tag name file to the external computer via the cable interface.

30. (previously presented) A method using an electronic camera for capturing images representing a variety of subjects and for providing captured images to an external computer in response to a single computer initiated request, wherein the electronic camera is interconnected to the external computer via a cable interface, said method comprising the steps of:

storing [a plurality of categories] two or more tag names providing classification of the images [by subject];

selecting, by a user control, one of the stored tag names for each of the images;

assigning [at least one of the plurality of categories] the selected tag names to each of the images before the images are captured by the electronic camera, wherein each [category providing subject] tag name provides classification of [one] two or more images;

capturing the images with the electronic camera;

converting the images into digital image data; [and]

generating, by a camera processor, an [output image signal comprising an] image file including [both] the digital image data corresponding to the captured images and a separate tag name file for each selected tag name [separate category data including the one or more categories selected by a control, wherein the category data is separately accessible for each image apart from the image data];

storing each of the image files into the tag name file corresponding to the selected tag name, wherein the camera stores two or more tag names files with each tag name file storing two or more image files; and

identifying, in response to a computer initiated request, a particular tag name and transferring all of the image files stored in the tag name file corresponding to the identified particular tag name to the external computer via the cable interface.

31. (previously presented) The electronic camera according to claim 1 wherein the control means is a user control.

33. (previously presented) The electronic camera according to claim 29 wherein the control means is a user control.

35. (previously presented) The electronic camera according to claim 1 wherein the [at least one particular category] tag name is selected on the computer.

36. (previously presented) The electronic camera according to claim 35 wherein [the computer is interconnected to the electronic camera via a cable

interface, and wherein the plurality of categories] tag names are communicated from the electronic camera to the computer via the cable interface, and the at least one particular [category] tag name is selected on the computer and downloaded to the electronic camera via the cable interface.

37. (previously presented) The electronic camera according to claim 29 wherein the [at least one particular category] tag name is selected on the computer.

38. (previously presented) The electronic camera according to claim 37 wherein [the computer is interconnected to the electronic camera via a cable interface, and wherein the plurality of categories] the tag names are communicated from the electronic camera to the computer via the cable interface, and the at least one particular [category] tag name is selected on the computer and downloaded to the electronic camera via the cable interface.
